

Project Overview: Movie App

Tech Stack: React.js, Firebase, Redux Toolkit, TanStack Query, React Hook Form, Tailwind CSS

Key Technical Features

1. Advanced Authentication System

- **Dual Login Options:** Fully implemented **Login and Sign-up** functionality using Firebase Auth.
- **Google OAuth:** One-tap **Login with Google** for a frictionless user experience.
- **Secure Validation:** Form handling and schema validation (Email, Password strength) are managed via **React Hook Form**, ensuring a smooth and error-free onboarding process.

2. Netflix-Inspired UI & Dynamic Theme Engine

- **Responsive Design:** A fully adaptive UI built with **Tailwind CSS**, optimized for mobile, tablet, and desktop.
- **Light/Dark Mode:** A built-in theme switcher allows users to toggle between a cinematic "Netflix-style" Dark Mode and a clean, high-contrast Light Mode.

3. High-Performance Data Management

- **State Management:** **Redux Toolkit (RTK)** is utilized to manage global UI states, such as user sessions and theme preferences.
- **Efficient Data Fetching:** **TanStack Query (React Query)** handles movie API calls, providing out-of-the-box caching, loading states, and background data synchronization to ensure the app feels lightning-fast.

4. Movie Discovery & Interactive Catalog

- **Smart Search & Multi-Filters:** Search movies by title or filter the library by **Genre, Quality, Rating, Year, and Language**.
- **Smart Sorting:** Users can re-order results by "Latest Release" or "Top Rated."

- **Visual Thumbnails:** High-quality movie poster cards with a "View Full Detail" trigger.

5. Cinematic Detail View & Media Player

- **Deep Integration:** Detailed pages featuring plot synopses, IMDB ratings, and metadata.
- **In-App Trailers:** Watch high-definition trailers directly via an integrated video player without leaving the application.

6. Personalization & Firebase Cloud Storage

- **Persistent Favorites:** Users can "Heart" movies to save them to their personal Watchlist.
- **Real-time Sync:** All favorite data is stored in **Firebase Firestore**, meaning a user's saved movies are instantly available across all their devices.

"The Extra Edge" (Amazing Add-ons)

- **Skeleton Loading:** Instead of boring spinners, I've implemented **Skeleton Screens** (shimmer effect) while movie data is fetching, providing a much more premium feel.
- **Infinite Scroll:** As users browse, more movies load automatically as they scroll down, just like modern streaming platforms.
- **Toast Notifications:** Real-time feedback using **React Hot Toast** for successful logins, added favorites, or error handling.
